Baseline Vitality Assessment Report

Client:	Nakul Singh
Assessment Date:	11 November 2026

Executive Summary

Nakul presents with a strong physical foundation and significant potential for improvement. The assessment revealed above-average muscle mass, good lower-body strength, balanced movement patterns and no obvious functional limitations. These findings provide a strong platform from which to improve health, body composition and overall vitality. The most significant opportunities identified are:

- Reducing excess body fat
- Improving aerobic fitness
- Enhancing sleep quality and recovery
- Improving breathing efficiency
- Developing muscular endurance
- Managing stress more effectively

Most importantly, the assessment identified no major structural weaknesses. The focus moving forward is therefore not rehabilitation but optimisation. With consistent effort and structured coaching, significant improvements in energy, fitness, health markers and overall wellbeing are achievable over the next 3-6 months.

Why You Came To TLA

Primary Goal: Long-Term Health | Importance: 9/10 | Confidence: 6/10 | Obstacles: Motivation, Knowledge

---

Lifestyle & Vitality Snapshot

Sleep: 6–7 hrs | Waking Refreshed: 2/5 | Stress: 8/10 | Active Days: 2/week | Energy Dips: Mid-morning & Evening

Although sleep duration is reasonable, your low refreshment score suggests sleep quality and recovery may be limiting daily performance. Current stress rating of 8 is one of the strongest indicators identified within the questionnaire and may be contributing to: reduced energy, reduced recovery, increased fatigue, lower motivation and challenges with body composition improvement.

Overall, lifestyle data suggest that improving recovery and stress management has the potential to produce meaningful benefits beyond fitness alone.

Body Composition Assessment

Metric	Weight	BMI	Skeletal Muscle Mass	Body Fat Mass	Fat Free Mass	Soft Lean Mass	Total Body Water	Basal Metabolic Rate	Bone Mineral Content	Phase Angle
Result	94.3 kg	28.5	40.5 kg	28.6 kg	71.5 kg	67.2 kg	52.4 kg	1,876 kcal/day	4.1 kg	6.4°

Your **Skeletal Muscle Mass** represents a strong muscular foundation and places you in an excellent position to improve body composition without needing to build substantial amounts of additional muscle. Muscle mass is one of the strongest predictors of: Healthy ageing, Functional independence, Metabolic health and Injury resilience.

Reducing body fat whilst preserving existing muscle should become the primary body composition objective. Potential benefits include Increased energy levels, improved cardiovascular health, reduced joint loading, improved movement efficiency and better metabolic health.

Your **Hydration & Cellular Health** (Phase Angle: **6.4°**) falls within the average range and suggests reasonable cellular health. Further improvements may occur through: Resistance training, improved sleep quality, better hydration habits, improved nutrition and aerobic fitness development.

TLA Body Composition Summary: strong muscular foundations with considerable opportunity for body re-composition and improved metabolic efficiency.

Respiratory Assessment

The BOLT (Body Oxygen Level Test) score provides insight into breathing efficiency and carbon dioxide tolerance. Your score of 19 seconds suggests breathing efficiency may be slightly below optimal. At present this may contribute to earlier feelings of breathlessness, increased heart-rate response to effort, reduced exercise efficiency, or reduced resilience during stress.

We recommend Short-Term Goal of targeting **25-30 seconds**, and Long-Term Goal of **30+ seconds.** Improvements in this area often support better exercise performance, calmer breathing patterns and improved resilience under physical and mental stress.

Strength & Functional Capacity Assessments

Assessment	Result	TLA Remarks
Single Leg Press (5+RM)	100kg/leg	Good strength; Excellent left/right symmetry; No meaningful strength imbalance identified
Leg Extension (5RM) *hamstring*	45kg	Balanced
Leg Curl (5RM) *quadriceps*	45kg	Balanced
Wall Sit	20 sec	Endurance Opportunity
Single Leg Squat	4 reps/side	Good Control; Symmetrical between both sides; Demonstrated good functional movement capacity. No major limitations were identified.

Your balanced ratio between the muscles on the front and back of the thigh supports: knee health, injury resilience, efficient movement and long-term mobility. This was one of the strongest findings from the assessment.

The average hold time of 20 seconds for your **Wall Sits** implies that while absolute strength is strong, muscular endurance currently appears lower than expected. This suggests the opportunity to improve fatigue resistance within the lower body through targeted conditioning work. Benefits of improvement include improved walking endurance, better stair climbing, enhanced day-to-day energy and increased physical resilience.

Aerobic Fitness Assessment

Research consistently identifies VO_2 Max as one of the strongest predictors of longevity as it measures cardiovascular fitness, aerobic capacity, biological vitality and longevity-related fitness markers. It will become one of the key performance indicators monitored throughout your TLA journey.

Assessment	Result / Status	TLA Remarks
VO_2 Max	pending	Planned action is to complete a formal VO_2 Max assessment and establish a definitive cardiovascular baseline.

TLA Vitality Scorecard

Current Strengths	Key Development Opportunities
✅ Strong muscle mass	🔶 Body fat reduction
✅ Good lower-body strength	🔶 Aerobic fitness
✅ Excellent left/right balance	🔶 Sleep quality and recovery
✅ Balanced quadriceps and hamstring development	🔶 Stress management
✅ Functional control and stability	🔶 Breathing efficiency
✅ Clear motivation linked to family and long-term health	🔶 Muscular endurance
✅ No significant physical limitations identified	🔶 Consistency of physical activity

90-Day Priorities

#	Priority	Action	Success Measure
1	**Improve Body Composition**	Focus on gradual fat loss whilst preserving existing muscle mass	• Reduction in body fat mass • Maintenance or improvement of skeletal muscle mass
2	**Improve Aerobic Fitness**	Introduce structured Zone 2 cardiovascular training + VO_2 Max assessment and future reassessments	• Improved cardiovascular fitness • Reduced exercise heart rate • Improved energy levels
3	**Improve Sleep & Recovery**	Focus on sleep quality and stress management	• Improved waking refreshment score • Reduced daily fatigue • Greater consistency of energy
4	**Improve Breathing Efficiency**	Implement simple respiratory training + breathing awareness strategies	• BOLT score improved >= 25 seconds • Improved stress resilience

Overall TLA Assessment

Nakul presents as an individual with strong physical potential and a solid foundation upon which meaningful improvements can be built. The assessment demonstrates good muscular development, strength, stability and functional movement. What currently appears to limit vitality is not a lack of physical capability but rather a combination of excess body fat, lower aerobic fitness, elevated stress levels and suboptimal recovery.

The positive finding is that all these areas are highly trainable.

With structured guidance, consistent habits and objective monitoring, the outlook for improved energy, fitness, health span and long-term wellbeing is extremely positive.

Closing Remarks

Nakul, thank you for taking the first step on your longevity journey. This report represents the starting point, not the destination. Your results indicate significant untapped potential, and we look forward to helping you unlock it.

Best wishes,

YOUR TLA SUPPORT TEAM

Helping You Unlock Your Longevity Advantage
